

# A decision support system adapted to the constraints and the challenges of decision support in customary medical consultations

Ph.D. Thesis Defense

Antoine RICHARD<sup>1,2</sup>

*Under the supervision of:*

Yves MEINARD<sup>1</sup>, Alexis TSOUKIAS<sup>1</sup>  
Brice MAYAG<sup>1</sup> and François TALBOT<sup>3</sup>

2021, 6th of April

## 1 Context & Objectives

- Why support physicians?
- The HCL and Easily®

## 2 Supporting physicians during consultations

- Current clinical decision support systems
- Reasons behind the non-acceptance of DDSSs
- An approach adapted to support customary consultations

## 3 Studying practical medical consultations

- Analyses of physicians' work processes
- Models of physicians' decision processes during consultations
- Current needs of physicians during consultations

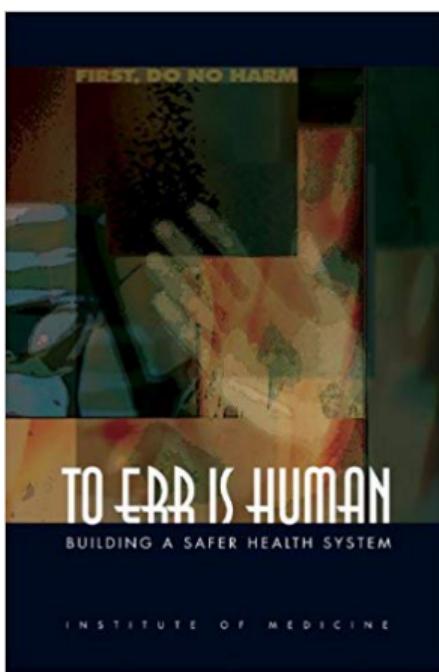

## 4 Proposing an acceptable decision support system

- A multi-label classification problem
- A “transparent” system to improve acceptability
- A virtual assistant dedicated to supporting medical consultation

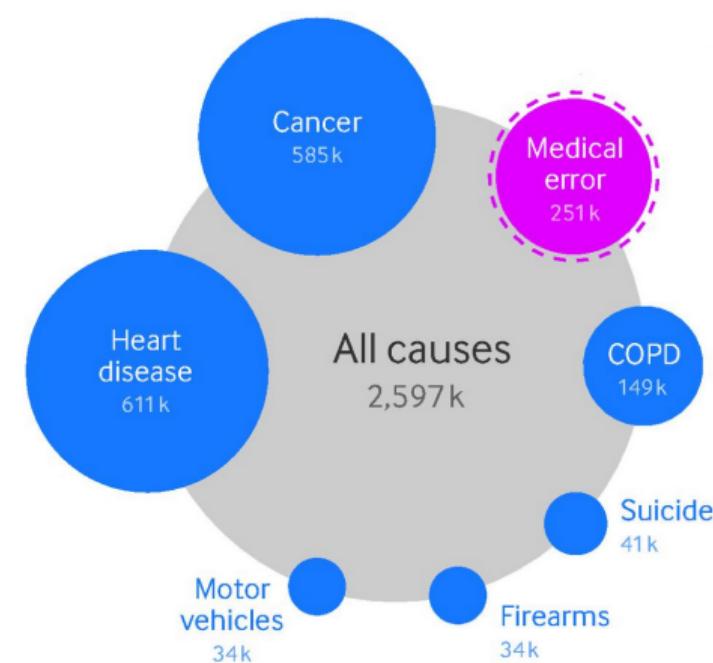

## 5 Conclusion

## Preventable medical errors are a major cause of death

Between 44k to 98k death in the US in 1997

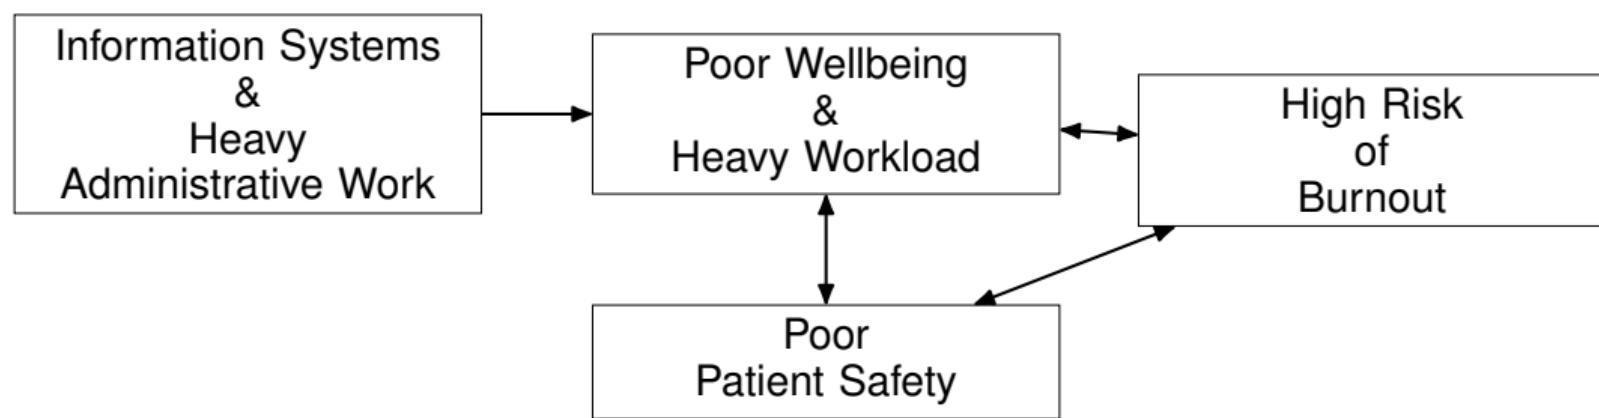

The third cause of death in the US in 2013

(Donaldson, Corrigan, Kohn, et al. 2000)

(Makary and Daniel 2016)

## Clinicians' workload is highly correlated with medical errors

(Hall et al. 2016; Tawfik et al. 2018; Bertillot 2016; West, Dyrbye, and Shanafelt 2018)

## Social demands for reducing clinicians' workload

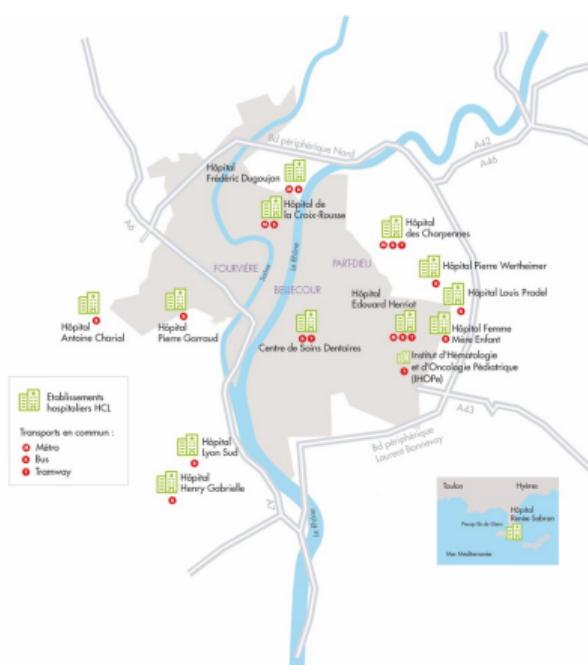

(Bertillot 2016; Dutheil et al. 2019; El-Hage et al. 2020)

# The Civil Hospitals of Lyon (HCL)

14 hospitals around Lyon (France)

Customary medical consultations,  
a major part of the HCL's activities

internal sources

# User interface of Easily® for medical consultations (with a fictitious patient)

The screenshot displays the Easily® software interface for managing medical consultations. At the top, the patient profile is shown: '♀ GRANGER Hermione' (born 19/09/1979, 41 years and 2 months old) with the identifier IPP : 10502711. The main navigation bar includes tabs for 'Histoire' (History), 'Visionneuse documents' (Document Viewer), and 'Dossier de spécialité' (Specialty File). On the left, a vertical sidebar lists categories: Soir, Dîner, Primi, Recette, Télécharger, Transmissions cellulaires, Panneau, Diagramme, and Chirurgie.

The 'Histoire' section shows a list of medical events:

- 08/02/2018 C 21048 - MED.INTERNIE O (1 document)
- 08/02/2018 CR de consultation test 2 HCL, M (1 document)
- 27/09/2017 C 31403 - CHIR. ORTHO TRAU PED (REYNAUD, S) (1 document)
- 27/09/2017 Fiche de consultation REYNAUD, S (1 document)
- 22/05/2017 VENUE INCONNUE (4 documents)
  - 22/05/2017 CR Urgences HCLASUR, M (1 document)
  - 22/05/2017 Ordonnance Ordonnance points ... HCLASUR, M (1 document)
  - 22/05/2017 Certificat Certificat présence ... HCLASUR, M (1 document)
  - 22/05/2017 Ordonnance Ordonnance Kiné HCLASUR, M (1 document)
- 22/02/2017 C 21048 - MED.INTERNIE O (1 document)
- 22/02/2017 CR de consultation HCLSECR1 (1 document)

The 'Visionneuse documents' section shows a preview of a prescription card for 'Toxines botuliques dans la vessie' (Ordonnance ECBU, Le 16/11/2017).

The 'Dossier de spécialité' section shows a prescription card for 'ECBU' (Le 30/11/2017) and a 'Vérification ECBU' (Le 01/12/2017).

The right side of the interface includes a 'Panier' (Basket) containing 0 document(s), a 'Visionneuse CR' (Consultation Report Viewer) section, and a 'Données Patient communes' (Common Patient Data) panel. This panel displays patient details such as Poids (70 kg, measured on 08/02/2018), Taille (Non renseignée), IMC (Non calculable), and Surface corporelle (Non calculable). It also includes a 'Modifier' (Edit) button and a 'Filtre' (Filter) section with 'Toutes les DPCs' selected. A table below lists DPCs (Diagnostic-Related Groups) with columns for Libellé (Label), Valeur (Value), Auteur (Author), and Date.

Libellé	Valeur	Auteur	Date
Evaluation de la douleur (0 à 10)	0	HCLASUR, M	22/05/2017 17:20
Température (°C)	37.5	HCLASUR, M	22/05/2017 17:25

At the bottom, a navigation bar shows 'Chirurgie programmée du genou' (18/22), 'Suivi pompe insulinique' (1/17), and other links like 'Post-it', 'Agenda', 'Antécédents', 'Rech. Clin.', and 'Plus...'.

# Groups of hospitals currently using Easily® in France (deployed by Hopsis)

internal sources

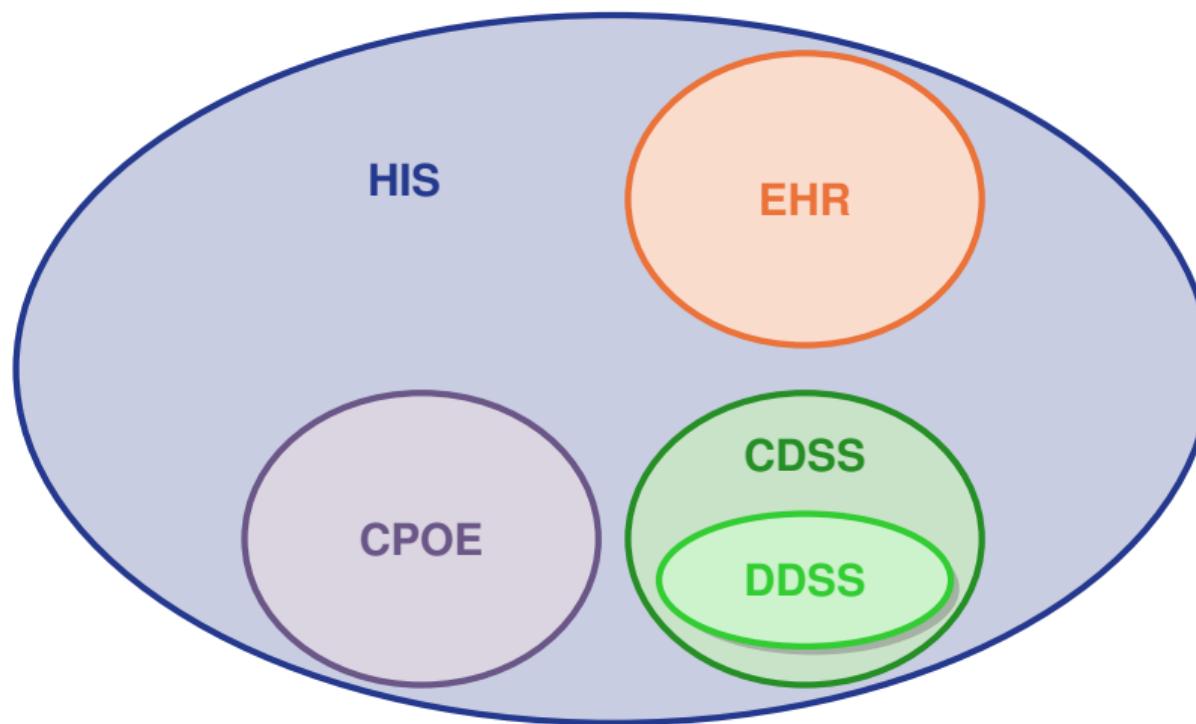

# Objective: proposing a decision support system for customary medical consultations

## How to support physicians during customary medical consultations?

### Thesis:

An adapted and acceptable decision support system must respect the know-how of physicians and leave them the responsibility of the decisions taken during consultations, by limiting itself to providing them with pieces of information on their patients which are necessary for their decision-making

## Definitions

**CDSS:**

Clinical Decision  
Support System

**DDSS:**

Diagnostic Decision  
Support System

**HIS:**

Health Information  
System

**CPOE:**

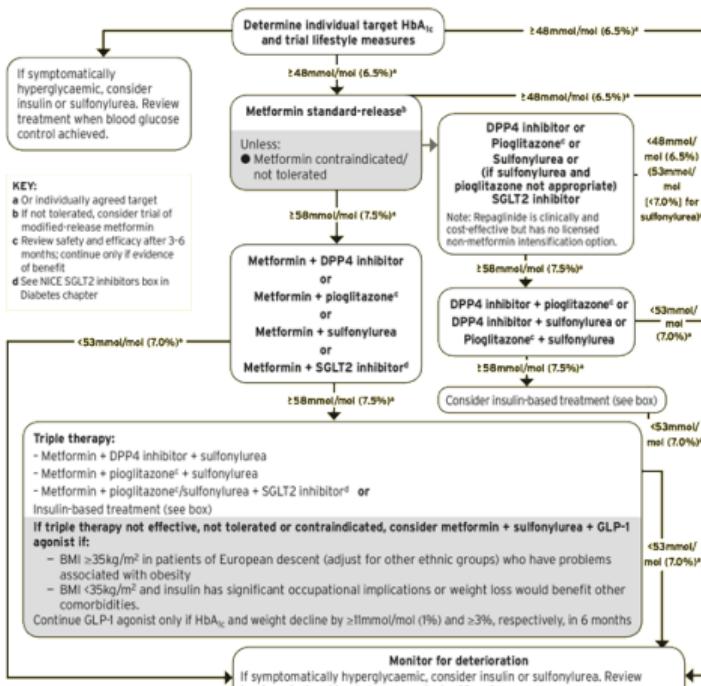

Computer Physician  
Order Entry

**EHR:**

Electronic Health  
Record

Current clinical decision support systems

# Guideline-based DDSSs

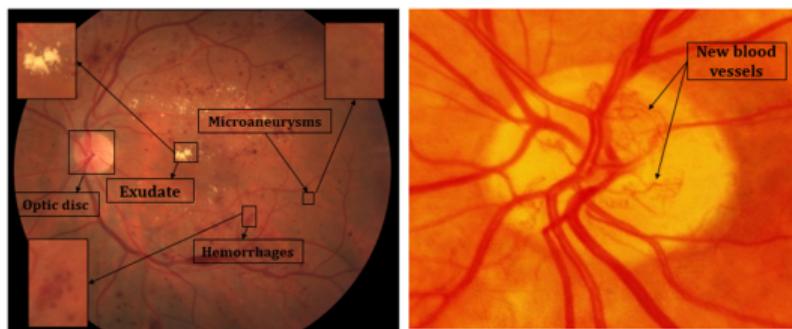

## Summary of NICE's guidelines on treatments for type 2 diabetes

source: <https://www.mims.co.uk/management-type-2-diabetes-nice-guideline/diabetes/article/891805>

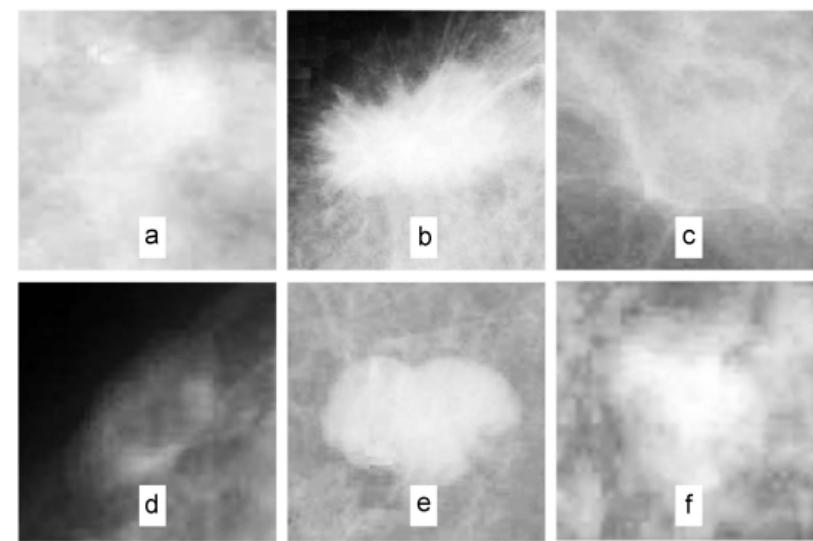

# ML-based DDSSs

## Identification of ocular diseases

(Asiri et al. 2019)

## Detection of breast nodules

(Joo et al. 2004; Miranda and Felipe 2015)

## A paradoxical situation for DDSSs

Can improve physicians' diagnostic skills in trials

Are overridden or ignored in practice

(Povyakalo et al. 2013; Kirby et al. 2018)

(Sittig et al. 2006; Onega et al. 2010; Masud, Al-Rei, and Lokker 2019)

## Several barriers

### A fear to lose diagnostic skills

Wrong recommendations tend not to be detected by physicians  
(Tsai, Fridsma, and Gatti 2003)

Decrease the diagnostic skills of experienced physicians  
(Povyakalo et al. 2013)

### A lack of agreement

“Black boxes” prompting distrust  
(Cabitza, Rasoini, and Gensini 2017)

Physicians report a fear to lose control of their decisions  
(Heeks 2006)

## Responsibility issues

If a physician has used a DDSS and DDSS's recommendations have led to a medical error, who is responsible?

Health Institutions?

Physicians?

Engineers?

Nobody?

**There is social pressure on the responsibility of physicians using DDSSs**  
(Itani, Lecron, and Fortemps 2019)

## Rationally select an adapted approach to support decision

According to Meinard and Tsoukiàs 2019, several approaches possible:

### Conformist

Decisions must **conform** to **irrevocable** “gold-standards”

### Objectivist

There are **objective** and **unquestionnable** facts and theories that should determine the decision

### Adjustive

Support must **adjust** itself to the **sanctified** capacity for initiative of decision-makers

**Identifying the dominant constraint binding decision support is necessary to choose the most relevant approach**

An approach adapted to support customary consultations

## The case of decision support for child health in developing countries

(Dalaba et al. 2014; Bessat, Zonon, and D'Acremont 2019; Bernasconi et al. 2019)

- Caregivers are not necessarily well-trained physicians
- Caregivers can ignore the best practices for specific diseases

### Main constraint:

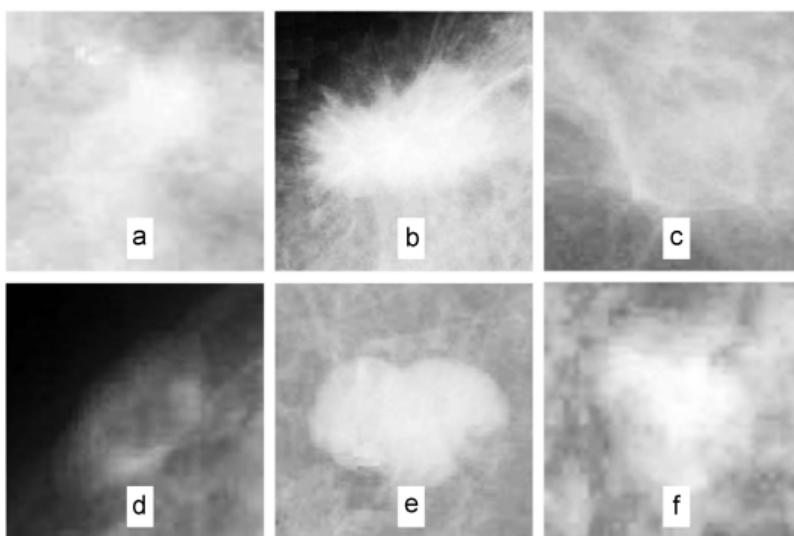

Clinical decisions must **conform** to guidelines of health authorities to minimize medical errors  
(Reider 2016)

A **conformist** support, such as Guideline-based DDSS, is relevant

An approach adapted to support customary consultations

## The case of decision support for the detection of nodules by radiologists

(Joo et al. 2004; Miranda and Felipe 2015)

- ML algorithms outperforming physicians capacity for image analysis
- Large amount of cases available

### Main constraint:

There are tools based on **objective** facts and theories that should be used to optimize nodules detection

(Yanase and Triantaphyllou 2019)

An **objectivist** support, such as ML-based DDSS, is relevant

## The case of decision support for customary medical consultations

- 1 Physicians are competent to conduct customary consultations
- 2 Their responsibility is highly engaged
- 3 They want to stay in charge of their decision processes

### Main constraint:

Decisions depend on physicians' idiosyncrasies, expertise, and capacity for initiative

**Must adjust decision support to physicians' needs and preferences**  
and not interfering with their capacity for initiative

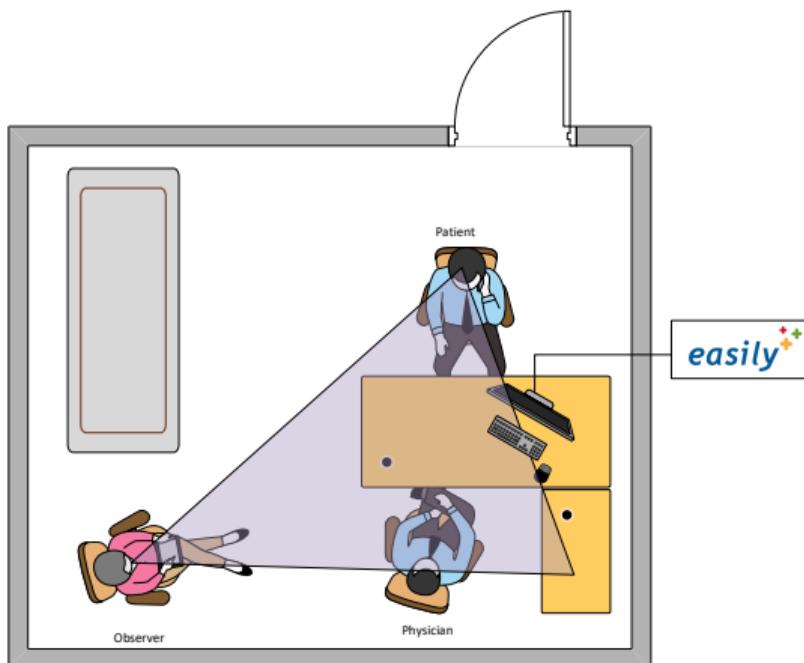

An approach adapted to support customary consultations

## Our positionning

An **adjustive** approach can rationally and legitimately be selected to support customary medical consultations

**It implies that the needs of physicians should be analyzed**

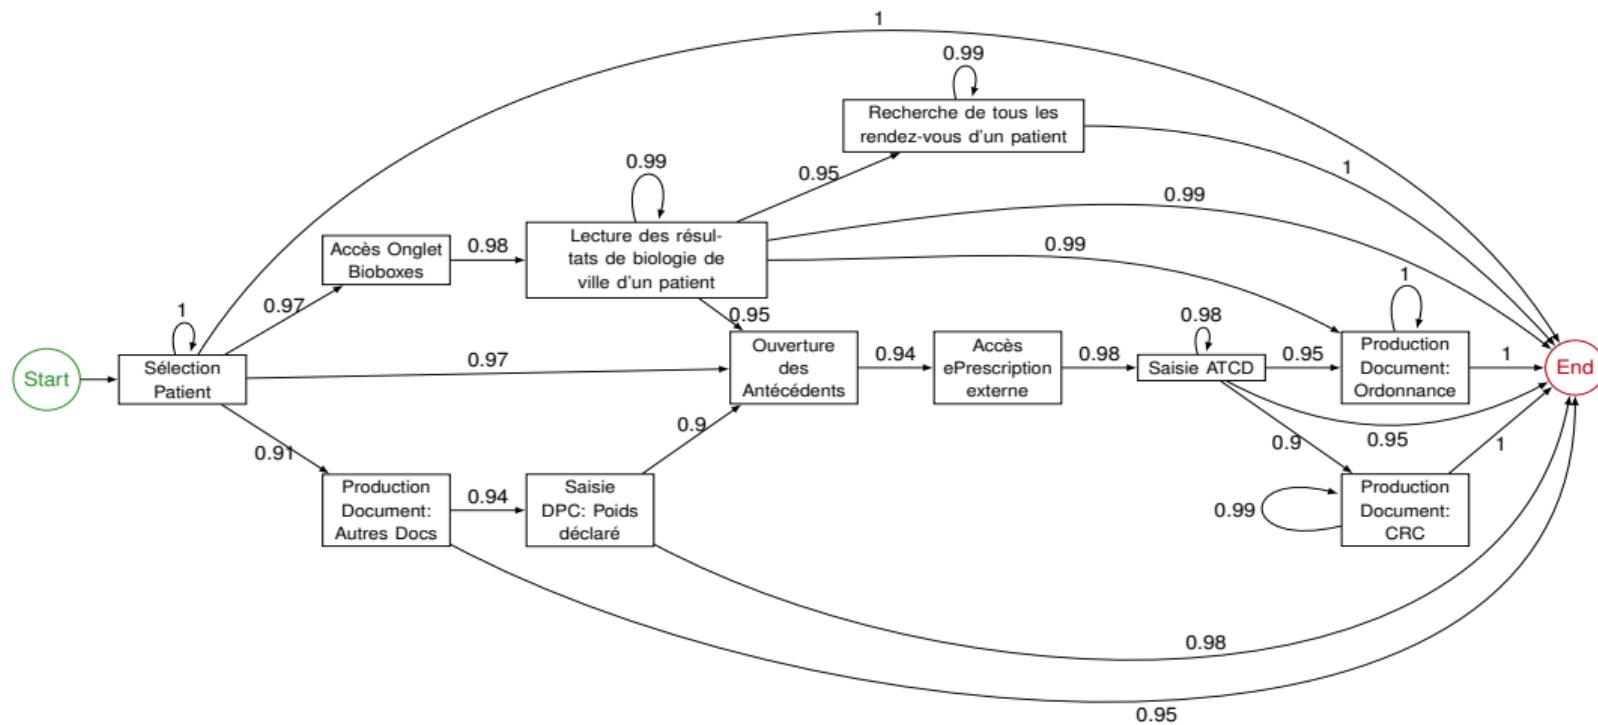

# Field observations (17 consultations by 2 physicians)

## Preliminary results

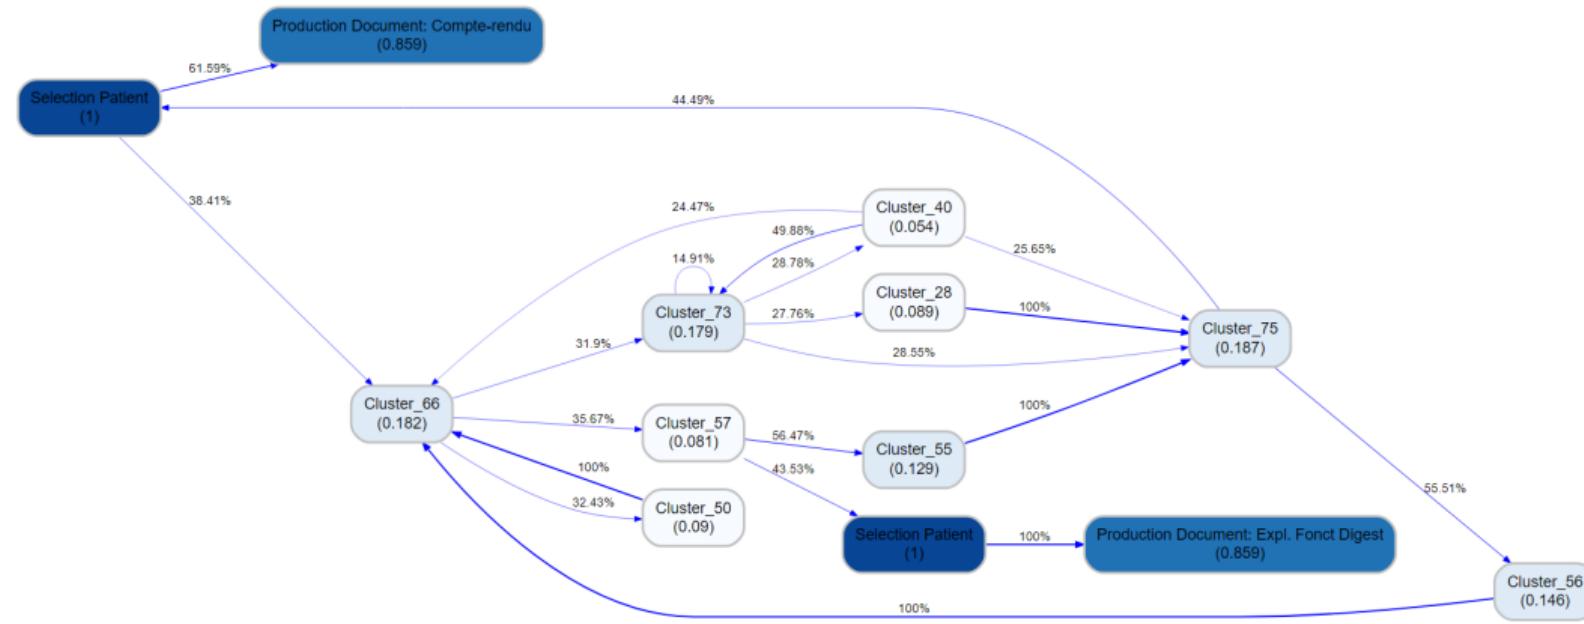

- Two kinds of actions performed by physicians:
  - 1 Searching for pieces of information concerning the patient
  - 2 Producing an order (ex. drug prescription)
- Action [1] occurs more frequently than action [2]
- Consultations end by the production of a summary document

## Process Mining (3439 consultations by 75 physicians) - Heuristic Miner

\* **Bioboxes:** Biology Module | **DPC:** Commun Data | **Antécédents (ATCD):** Medical Background | **CRC:** Consultation Report

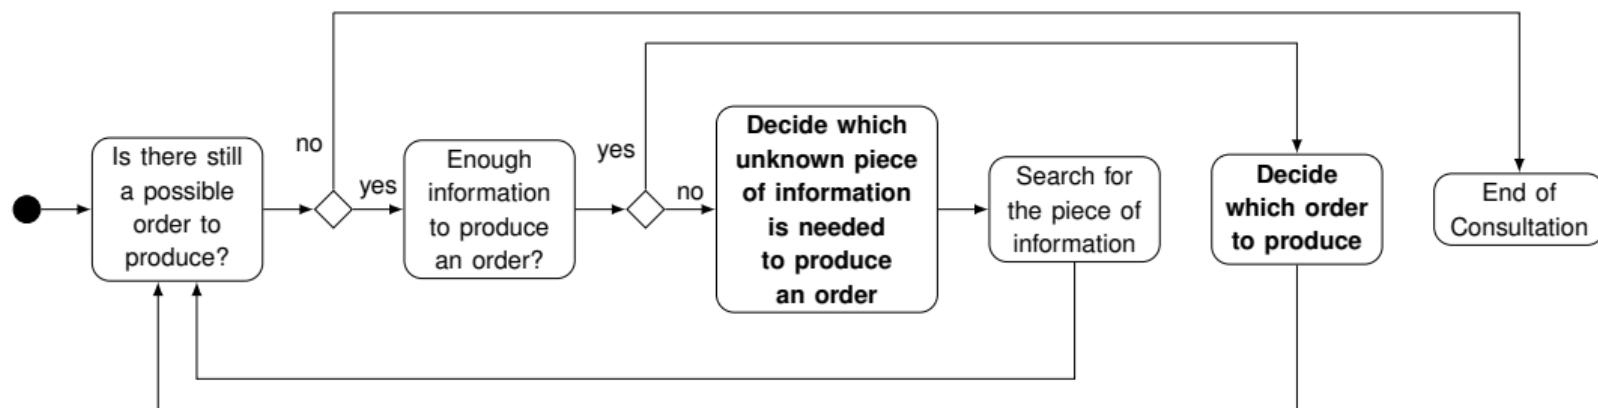

## Process Mining (3439 consultations by 75 physicians) - Fuzzy Miner

Analyses reproducible at: [https://git.lamsade.fr/a\\_richard/consultation-process-analysis](https://git.lamsade.fr/a_richard/consultation-process-analysis)

# Formalizing specific consultations

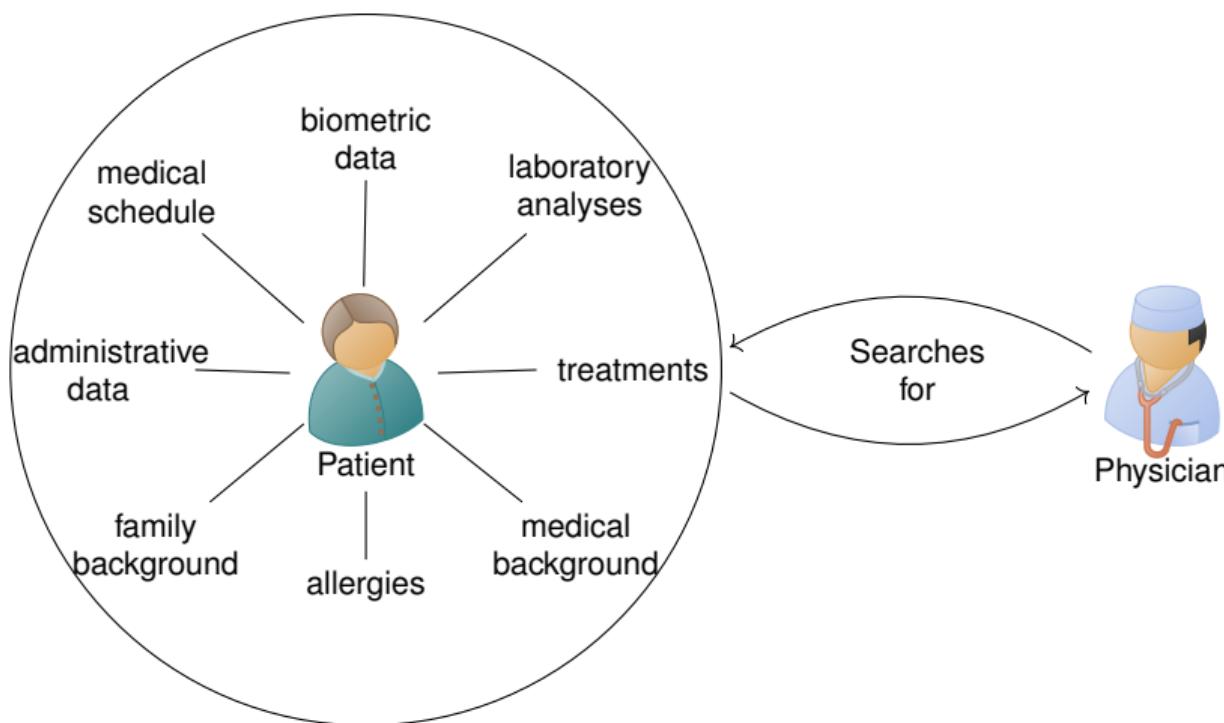

$T_c$	$\chi$							$\mathcal{A}$
	Sex	Age	BMI	Disease	HDL	LDL	TG	
$t_0$	♂	55	∅	HChol	∅	∅	∅	Search for HDL
$t_1$	♂	55	∅	HChol	1.1	∅	∅	Search for LDL
$t_2$	♂	55	∅	HChol	1.1	5.53	∅	Search for TG
$t_3$	♂	55	∅	HChol	1.1	5.53	1.98	Prescribe Ezetrol
$t_4$	♂	55	∅	HChol	1.1	5.53	1.98	Search for BMI
$t_5$	♂	55	24.43	HChol	1.1	5.53	1.98	End of Consultation

# A generic model of physicians' decision processes

Current needs of physicians during consultations

# The core process of customary medical consultations

# Our positionning

## Physicians mainly need:

Pieces of information  
on their patients

Not guidelines

Not recommendations

## Constraints:

Possibly available in  
Easily® database, but

:

it's time-consuming  
to get them

## Objective: anticipating and providing pieces of information needed by physicians

### How to know which pieces of information are needed by physicians?

#### Hypothesis:

Physicians are competent and do not look randomly at data on patients, so we can learn their needs based on their activities

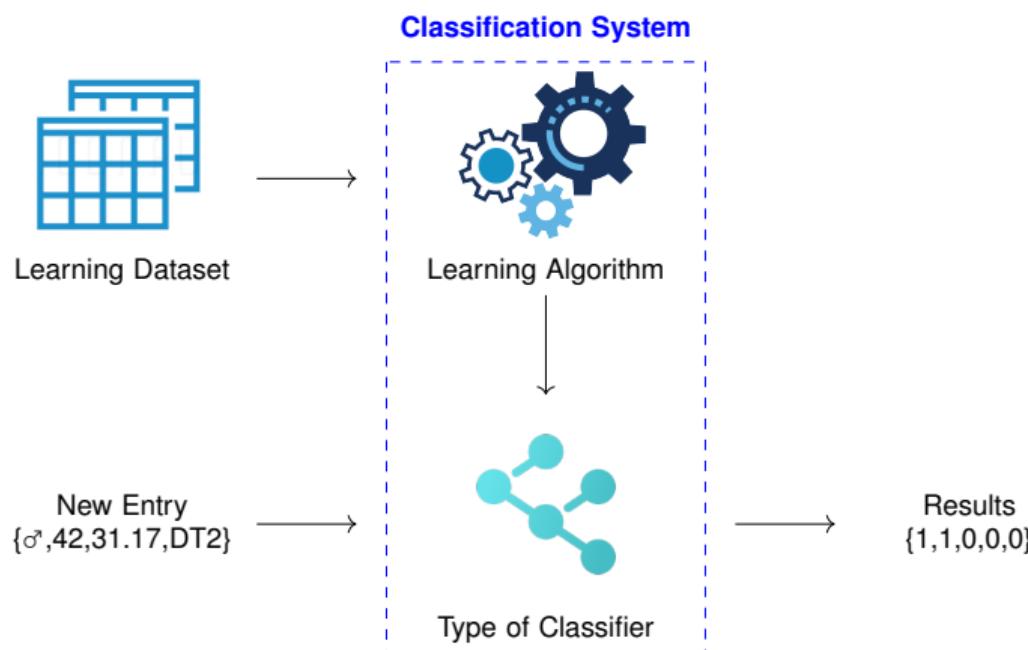

A multi-label classification problem

# From specific consultations to a multi-label dataset

$T_c$	$\mathcal{X}$							$\mathcal{A}$
	Sex	Age	BMI	Disease	HDL	LDL	TG	
$t_0$	♂	55	Ø24.43	HChol	Ø	Ø	Ø	Search for HDL
$t_1$	♂	55	Ø24.43	HChol	1.1	Ø	Ø	Search for LDL
$t_2$	♂	55	Ø24.43	HChol	1.1	5.53	Ø	Search for TG
$t_3$	♂	55	Ø24.43	HChol	1.1	5.53	1.98	Prescribe Ezetrol
$t_4$	♂	55	Ø24.43	HChol	1.1	5.53	1.98	Search for BMI
$t_5$	♂	55	24.43	HChol	1.1	5.53	1.98	End of Consultation

$\mathcal{X}$ : pieces of information known on patients				$\mathcal{Y}$ : pieces of information on patients needed by physicians					
Sex	Age	BMI	Disease	HbA1c	Blood Sugar	HDL	LDL	Creatinine	Microalbumin
♂	55	24.43	HChol	0	0	1	1	0	0
♂	49	24.00	HTN	1	1	0	0	0	0

## Learning which pieces of information are needed

### Looking for “transparent” systems

- To improve acceptability  
(Sinha and Swearingen 2002, Holzinger et al. 2017)
- To decrease workload  
(Bertillot 2016, West, Dyrbye, and Shanafelt 2018)

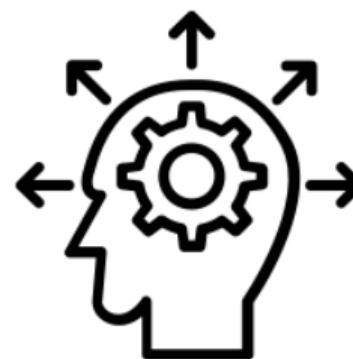

## "Transparency" requirements

### Understandable

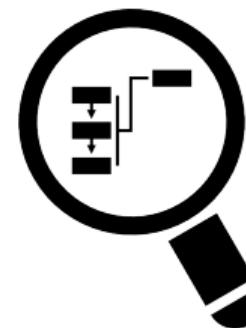

Must be based on notions already known to physicians  
(Montavon, Samek, and Müller 2018)

### Interpretable

Must ensure that physicians reach conclusions without bias  
(Spagnolli et al. 2017)

### Retraceable

Must allow tracing back algorithm's actions  
(Hedbom 2008)

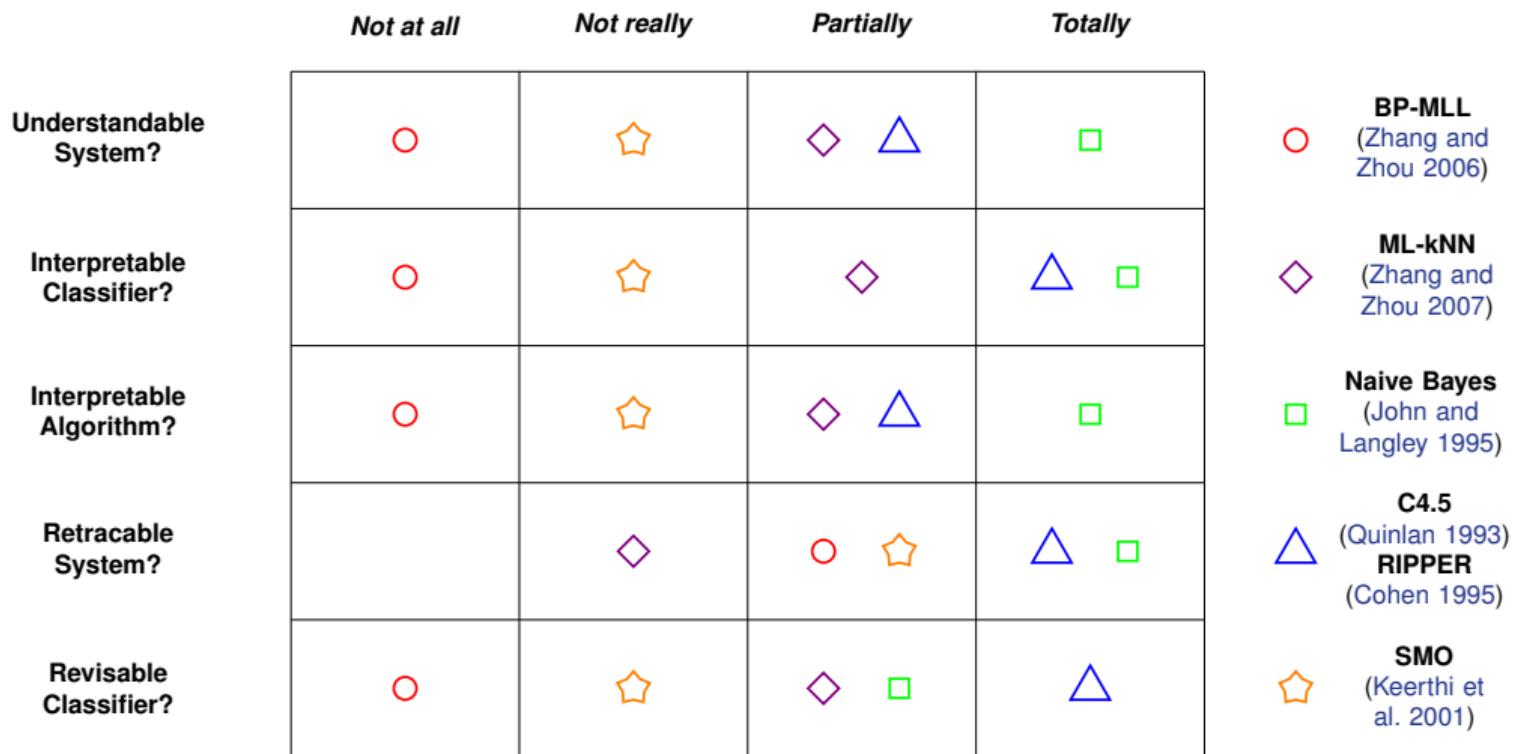

### Revisable

Must take into account feedback from physicians  
(Zarsky 2013)

A “transparent” system to improve acceptability

# Selection of a “transparent” classification system

# A Naive Bayes variation for multi-label classification

$$P(A|B) = \frac{P(B|A) \cdot P(A)}{P(B)}$$

Probability of B occurring given evidence A has already occurred

Probability of A occurring given evidence B has already occurred

Probability of B occurring given evidence A has already occurred

Probability of A occurring given evidence B has already occurred

## Why Naive Bayes?

**Understandable:**

basic probability theories are well-known by physicians

**Interpretable:**

the learning algorithm of Naive Bayes is simple to explain

**Retraceable:**

the probabilities used can be traced back

**Revisable:**

physicians' feedbacks can be used to update probabilities

A "transparent" system to improve acceptability

# Naive Bayes classification process

$\mathcal{X}$		$\mathcal{Y}$	
Age	Disease	HbA1c	HDL
42	DT2	1	0
52	HChol	0	1
24	DT1	1	0
67	HChol	1	1

Learning Dataset

Naive Bayes Learning Algorithm

$$P(\text{HbA1c} = 0) = 0.25$$

$$P(\text{HbA1c} = 1) = 0.75$$

$$P(\text{HDL} = 0) = 0.5$$

$$P(\text{HDL} = 1) = 0.5$$

New Patient  $X$ :  
 $\{42, \text{DT2}\}$ 

$$P(\text{Age} < 38.3 | \text{HbA1c} = 1) = 0.33$$

$$P(\text{Age} < 38.3 | \text{HDL} = 0) = 0.33$$

$$P(\text{Disease} = \text{DT2} | \text{HDL} = 0) = 0.5$$

 $\vdots$ 

Results:

$$P(\text{HbA1c} = 1 | X) = 0.99$$

$$P(\text{HDL} = 1 | X) = 0.000004$$

# High “transparency” doesn’t mean low performance

HCL

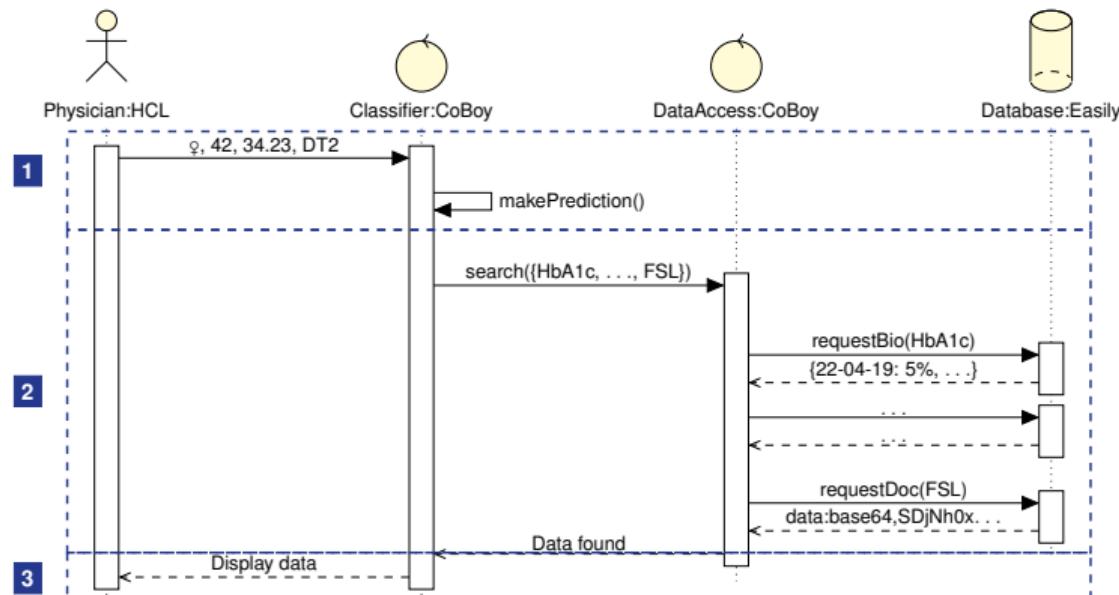

The screenshot displays the CoBoy application's user interface. On the left, there are three separate line graphs showing trends over time for HbA1c (9.7%), Microalbumine (51.24 mg/L), and DFG (45.38 mL/min/1.73m²). Each graph has a switch icon and a value with a '(e)' suffix. To the right of these graphs is a large central panel titled 'Synthèse et suivi'. This panel contains sections for 'Service: FEDERATION ENDOCINO DIABETO NUTRITION' and 'Patient: [redacted], née le [redacted], IPP'. It includes fields for 'Entrée Unité' and 'Sortie', 'Médecin référent' and 'Resp sortie'. A 'Corresponds' section lists 'Adresse par' and 'Médecin traitant'. Below this is a 'Probabilité' section with a message about needing blood tests. Further down are sections for 'Surrenales', 'Bilan annuel', 'Grossesse', 'Hypophyse', 'Dyslipidémie', 'Obésité', and 'Changement de schéma'. At the bottom of the central panel are sections for 'Suivi pour', 'Histoire de la maladie', 'Consultation - Synthèse séjour', and 'Signes généraux'. A table for height, weight, waist circumference, and BMI is partially visible. The top right corner shows a 'me déconnecter' link and the 'HCL' logo.

A virtual assistant dedicated to supporting medical consultation

# The process of the decision support system

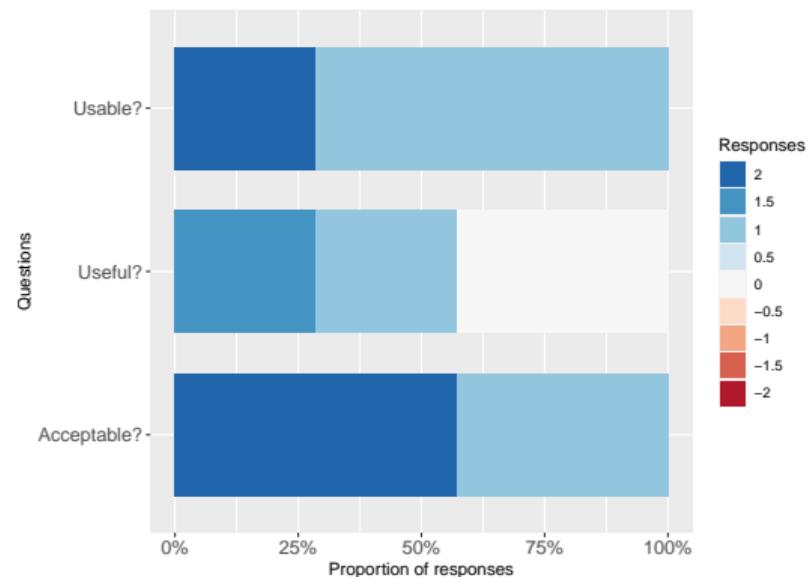

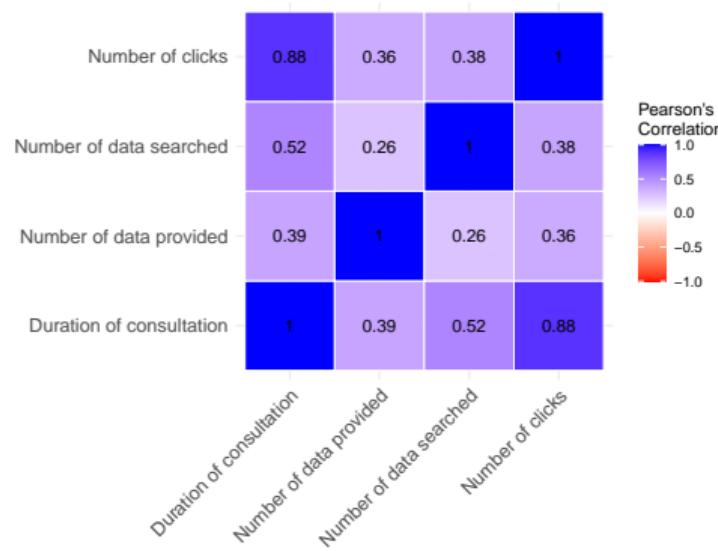

## Main phases

- 1 Anticipating pieces of information needed by physicians
  - 1 Rules defined by physicians
  - 2 Naive Bayes classifier
- 2 Searching for raw data for each piece of information
- 3 Displaying raw data collected for each piece of information

A virtual assistant dedicated to supporting medical consultation

## Clinical trials (49 consultations by 7 physicians)

Correlation matrix between each criterion observed during clinical trials of CoBoy

Distribution of answers to the satisfaction questionnaire

## 1 Context & Objectives

- Why support physicians?
- The HCL and Easily®

## 2 Supporting physicians during consultations

- Current clinical decision support systems
- Reasons behind the non-acceptance of DDSSs
- An approach adapted to support customary consultations

## 3 Studying practical medical consultations

- Analyses of physicians' work processes
- Models of physicians' decision processes during consultations
- Current needs of physicians during consultations

## 4 Proposing an acceptable decision support system

- A multi-label classification problem
- A “transparent” system to improve acceptability
- A virtual assistant dedicated to supporting medical consultation

## 5 Conclusion

# Thesis

An adapted and acceptable decision support system must respect the know-how of physicians and leave them the responsibility of the decisions taken during consultations, by limiting itself to providing them with pieces of information on their patients which are necessary for their decision-making

## Contributions

A critical analysis of clinical decision support systems  
(Richard et al. 2020b)

Modelization of physicians' decision processes during medical consultations  
(Richard et al. 2018)

Proposal of operational criteria to assess the “transparency” of multi-label classification systems  
(Richard et al. 2020a)

Development of a virtual assistant dedicated to supporting physicians' decisions during day-to-day medical consultations  
(work in progress: Richard et al. 2021)

## Perspectives

### Improving

the proposed system and deploying it into other hospital departments

### Rethinking

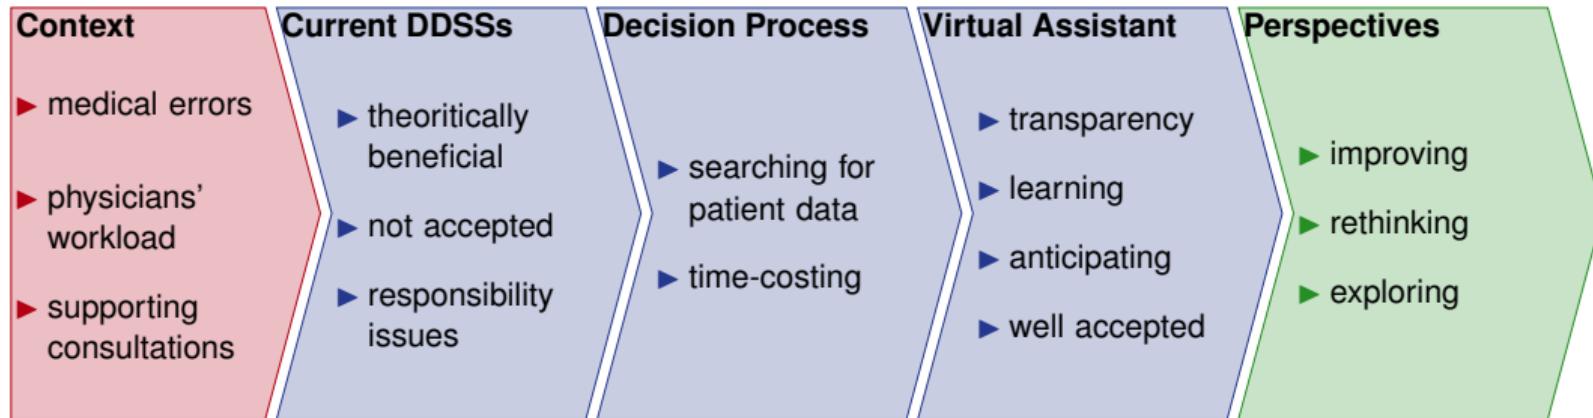

the role of information systems in clinical decision processes

### Investigating

the adjustive approach in domains where decision-makers' responsibility is highly engaged

# Thank you for your attention

# Synthesis
